SUMMARY

Builds the AI systems other people use to do their jobs. An agent operating system running an agency's content, 60+ versioned skills portable across three harnesses, and the self-hosted infrastructure underneath both.

EDUCATION

University of Houston

B.S. Computer Science

Expected May 2027

Houston, TX

WORK EXPERIENCE

Momenta Fire

May 2026 – Present

AI Systems and Marketing Intern

Tomball, TX

- Built Momenta OS, an AI agent operating system on a governed Google Drive vault that syncs brand voice, client context, and content rules across an 8-person agency team. Per-post content turnaround dropped from 45 minutes to under 10.
- Authored 60+ versioned agent skills as machine-readable runbooks for WordPress audits, SEO remediation, and site updates, reused across 3 AI harnesses without modification.
- Shipped a draft-score-revise-approve content pipeline with a structured feedback log, running LinkedIn content for 5+ industrial B2B client accounts.

Incarnate Editors

December 2022 – February 2025

Front-End Developer (Freelance)

Contract/Remote

- Programmed a full-stack data modeling application using React, Firebase, and Electron, allowing for visualization of 100+ data entries

LEADERSHIP EXPERIENCE

Lone Star College Cyfair, Computer Science Club

May 2022 – May 2025

President

Houston, Texas

- Led organization of 275+ members, increasing membership by 20% through targeted recruitment campaigns
- Hosted workshops on Git, web development, and computer engineering for 50+ students

PROJECT EXPERIENCE

Self-Hosted AI Agent Infrastructure

August 2026 – Present

- Deployed an OAuth-protected MCP context server behind SSO and an NGINX reverse proxy with wildcard TLS, giving 3 AI coding clients semantic recall over a shared knowledge base.
- Standardized every service on git-backed container stacks so the repository is the only deployment path and the estate rebuilds from a clean host with no manual compose steps.

Usage-Based Billing Platform

July 2026 – Present

- Client-facing work under Momenta Fire: building a billing dashboard that meters per-lead usage from a partner SaaS product into automated Stripe invoicing, with server-calculated integer-cent pricing, signed webhooks, event deduplication, and idempotent billing cycles.
- Shipped a GitHub Actions to Azure OIDC pipeline (verify, build, migrate, deploy) targeting App Service and PostgreSQL Flexible Server, with secrets held in Azure Key Vault under a system-assigned managed identity.
- Hardened authentication with Auth.js across password, Google, and email sign-in. Added mandatory per-login 2FA challenges, login throttling, and fail-closed behavior, covered by automated tests in CI.

Schematic Parsing AI Web Application

October 2025

- Led a team of 4 student software engineers to build a NotebookLLM-like chatbot in 24 hours
- Engineered a full-stack web app integrating React, Rust backend, and Gemini AI API for schematic analysis

SKILLS

Programming: HTML/CSS, C/C++, SQL, Python, Java, Kotlin, JavaScript, TypeScript, PowerShell, Bash, Rust

Software/Tools: Node.js, React.js, Vite, MySQL, PostgreSQL, Prisma, Docker, Git, Tailwind CSS, Linux/Unix, REST APIs

Cloud/DevOps: Azure App Service, Key Vault, GitHub Actions, OIDC pipelines, Stripe API, NGINX, Docker, Proxmox

AI/Agents: MCP context servers, agent skill registries, Claude Code, Codex CLI, OpenCode, Gemini API, OAuth2/SSO
